

1. Mobile User

User Story: "As a potential customer on my phone, I want to quickly find the shop's phone number and address, so that I can easily call for information or get directions while I'm on the go."

Detailed Description

- Objectives and Interaction: Mobile users usually require information in a timely and effective manner. Their main objective may be to locate the location or establish contact right away. The user must pinch-to-zoom and scroll horizontally to read text or locate contact information on the existing non-responsive website, making interaction challenging.
 - Usability and Navigation: The webpage should adjust to a single-column layout on mobile devices for improved usability. To provide a clean interface and conserve space, the navigation menu ought to fold into a "hamburger" icon.
 - Readability and Accessibility: Text needs to be readable without the need for zooming. Important details like the address should link straight to a map program, and the phone number should be a "tap-to-call" link. In order to improve accessibility for all users, buttons and links must be large enough to be readily pressed with a finger.
-

2. Tablet User iPad

User Story: "As a new pet owner browsing on my tablet, I want to explore the different services offered, like grooming and training, with clear descriptions and images, so that I can decide what's best for my pet."

Detailed Description

- Objectives and Interaction: Tablet users anticipate a visually stimulating experience and tend to browse more slowly than mobile users. Because they use touch to interact with the website, the navigation needs to be simple and responsive. Their objective is frequently exploratory, including looking at pet galleries or contrasting services.
- Usability and Layout: A multi-column grid should be used to adapt the website's layout to the tablet's larger screen, possibly aligning text and graphics side by side. By doing this, the claustrophobic sensation of a mobile layout and the overabundance of white space of a desktop style are avoided.
- High-quality, tap-expandable images are essential for readability and accessibility. The information must continue to be very readable, with buttons and link touch targets that are the right size for simple interaction. The entire experience ought to be well-designed and optimised for a touch-first interface.

3. Desktop User

User Story: "As a prospective pet adopter using my desktop computer, I want to view detailed information and multiple pictures for each type of pet available, so that I can conduct thorough research before visiting the shop."

Detailed Description

- Goals and Interaction: Desktop users have a large screen and precise navigation tools (mouse and keyboard), allowing them to consume detailed content easily. Reading thorough service descriptions, comparing various pet types, or conducting in-depth research are frequently their objectives.
- Usability and Navigation: For convenient access to all areas, the navigation bar should be fully displayed across the top of the site. Utilising the entire screen width, the layout should display content in a clear, multi-column format that reduces scrolling and facilitates simple information comparison.
- Readability and Accessibility: Clear, well-organised text and high-resolution photos are crucial. Interactivity can be enhanced via hover effects on buttons and links. The overall layout should be authoritative and thorough, offering a smooth research experience without the need for intricate navigation or zooming.
